Social Media Analytics Using Big Data Technologies

A Data Engineering Approach to Ingestion, Processing, Analysis, and Visualization

BIG DATA PROJECT PROPOSAL

Project Description

This project aims to analyze social media data using modern Big Data technologies. The collected data will be ingested, stored, processed, and analyzed to identify user engagement trends, content performance, and key metrics. The final insights will be delivered through interactive visual dashboards for actionable decision-making.

Project Objectives

1

Collect & Store Data

Ingest real-time and batch social media dataset into scalable distributed storage.

2

Efficient Processing

Process large datasets efficiently using distributed querying frameworks.

3

Behavioral Analysis

Analyze user engagement metrics and content performance patterns.

4

Interactive Dashboards

Visualize the analytics results through intuitive, executive dashboards.

Tools & Technologies & Dataset

Primary Dataset: Social Media Analytics Dataset (Kaggle)

Category	Technology / Tool	Project Purpose
Data Ingestion	Apache Flume	Reliable data streaming & ingestion into storage
Distributed Storage	Hadoop HDFS	Scalable file system for unstructured / semi-structured data
Data Processing	Apache Hive	HiveQL query execution & data warehousing
Data Visualization	Power BI	Interactive dashboard creation & insights reporting
Version Control	GitHub	Centralized repository for code, scripts & docs

Project Workflow Pipeline

Expected Deliverables

Big Data Storage

Clean, optimized, and organized Big Data dataset in HDFS / Hive.

Analytical Queries

Comprehensive HiveQL analytical queries and performance analysis results.

Executive Dashboard

Interactive Power BI dashboard summarizing key performance indicators and user trends.

Source Code & Repository

Complete GitHub repository containing source scripts, documentation, and implementation guides.
